PARSE

Contains functions to parse imaging data into a usable format

`vipertools.parse.parse_phenix(phenix_dir, flatfield_exported=True, parallel=False)`

Function to automatically rename TIFS exported from Harmony into a format where row and well ID as well as Tile position are indicated in the file name. Example of an exported file name: “Row{#}_Well{#}_{channel}_zstack{#}_r{#}_c{#}.tif”

Parameters

- **phenix_dir** – Path indicating the exported harmony files to parse.
- **flatfield_exported** – boolean indicating if the data was exported from harmony with or without flatfield correction.
- **parallel** – boolean value indicating if the data parsing should be performed with parallelization or without (CURRENTLY NOT FUNCTIONAL ONLY USE AS FALSE)
